Abstract— This paper shows the results of a survey performed in Spain about the different functionalities of e-learning platforms. This survey was filled in by a group of teachers, experts in Engineering Education along all Spain, through the Spanish Chapter of the IEEE Education Society. The paper shows the opinion on several aspects about the e-learning functionalities, such as knowledge level, usage level, usefulness, etc., as well as the most used platforms. One of the objectives of this work is to create a reflexive debate in the international community about the e-Learning platform use.

Keywords-component: e-learning platforms, e-learning functionalities

I. INTRODUCTION

During the last years E-Learning pla tforms (Learning Management Systems) have been a new c omponent that have increased their u se in H igher Education (as w ell as in small, middle and large companies) and proliferate in num ber in the learning a pplications scena rio. The Engine ering Educat ion domain has been aware of this tendency and their application in on-line, distance and traditional university education.

An e-learning platform is a software application installed in a web server, which is used to adm inister, distribute, and supervise the educational a ctivities of an organization or institution. Its main functions are to manage users, r esources, and educational materials and activities, to control the access, to super vise the learning process and progress, to mak e evaluations, etc.

This year 2009, a survey [1] about different aspects on the use of e-learning platforms in the Engineering Education was filled out by the CESEI (acronym in Spanish of the IEEE-ES-Spanish Chapter) group [2]. This group is promoted by the IEEE-ES Spanish Chapter [3] and currently is com posed by more than a hundred teachers of 40 universities along Spain, all of them deeply related with the Engineering Education.

This paper sho ws the most used e-learning platforms in Spain, the main functionalities of e-learning platforms, and the results of a survey about severa l aspects on t hese main functionalities, such as (i) Knowledge Level, (ii) Training, (iii) Usage, (iv) Perception of t raining profic iency, (v) Usefulness, and (vi) Preparation Effort. Finally, the paper ends with som e c onclusions and reflections about the results, and the future actions that could be made.

II. E-LEARNING PLATFORMS AND FUNCTIONALITIES

The first group of e -learning platforms considered for the survey were Moodle [4], Ilias[5], Dokeos [6], .LRN [7], Sakai [8], Clarolin e [9] a nd WebCT/ Blackboard [10]. They were selected ac cording to previous studi es, such a s [11] and a previous reduced survey on a selected group of users.

The questions on the survey were focused on the usa ge level of each e-learning platform on each university grade, and on the presential or on-line characteristic of its usage.

With respect to functionalities, they we reselected mainly from the Edutools Site [12], works [13][14] and the analysis of functionalities of the previous e-learning platforms.

As a consequenc e, the fo llowing functionalities were selected:

- Content D elivery: It is the m ost us ual functionality, and permits to deliver contents to students.
- e-mail: Intern al em ail is electronic mail that can be read or sent from inside an online course.
- Tasks-Exercises: They usually consist of some kind of material th at st udents h ave to upload to platform in response to some required activity.
- Forums: Discussion forum is a thre aded online text conversation between participants.
- Mailing lists: The y all ow to send mails to different users in a joint fashion.
- Exams: t he t ypical exams t o eva luate t he wor k of students.
- Self-assessment: This kind of tools enables students to assess his/her progr ess and kno wledge l evel o n a specific subject.
- Surveys: This functionality enables the possi bility of perform surveys to students on different topics.
- Groupwork: Group Work is the capacity to organize a class into groups and provide group work space that enables the instructor t o a ssign specific tasks or projects.

- Chat: Real-time chat is a conversation between people over the In ternet that in volves exchanging messages back and forth at virtually the same time.
- Calendar: it enables students to document their plans for a cour se and t he associa ted assignm ents i n a course.
- FAQs: It is the typ ical F requented A sked Q uestions service.
- Wikis: It is a service that allows the easy creation and editing of an y n umber of w eb pages, using a simplified text editor.
- Blogs: A blog (a contraction of the term "web log") is a type of functionality that permits an i ndividual to show regular entries of commentary, descriptions of events, or oth er ma terial, usually in chronological order.
- Glossaries: This functionality allows a way to present definitions that can be looked up by the students.
- Videoconference: It a llows two or more locations to interact via two-way v ideo and audio transmissions simultaneously.
- Notebook: I t enables s tudents t o make notes in a personal or private book. The personal notes can be shared w ith another stu dents a nd/or teachers, but private notes can not be shared.
- Whiteboard: Whiteboard tools include an elec tronic version of a dry-erase board used by instructors and learners in a virtua l classroom (also ca lled a smartboard or elec tronic w hiteboard) and o ther synchronous se rvices su ch a s a pplication sharing, group browsing, and voice chat.
- Learning Paths. This functionality, also called lessons, allows tea cher to a dd ent ire lessons tha t gu ide t he student base d on t he student's answers. It might be helpful to think of a lesson as a kind of flowchart.
- Student Portfolio: Student Portfolios are areas where students can showcase their work in a course, display their person al pho to, and lis t demographic information.
- Podcast: It is a ser ies of aud io f iles that can be downloaded from the e-learning platforms.
- Student Tracking: Student Tracking is the a bility to track the usage of course materials by students, and to perform a dditional ana lysis and r eporting both of aggregate and individual usage.
- Vodcast: It is a series of video files that can be downloaded from the e-learning platforms.

After a period of reflection and discussion, and based on the experience of the working team, we agreed that the questions about the see func tionalities w ere: (i) K nowledge Level, (ii) Training, (iii) U sage, (iv) P erception of training proficiency, (v) Usefulness, and (vi) Preparation Effort. We thought that these topics would help us to understand and improve the use of e-learning platforms in teaching/learning processes.

III. RESULTS

The survey was realized during the last days of May and first days of June, 2009. Finally the survey was completed by 162 teachers, where a 79 % was male and a 21% was female. The results shown us that only the 13% of the teachers did not use e-learning platforms, and the rest (87%) did use them.

The characteristics of the teachers can be seen in figures 1, 2 and 3. Figure 1 shows the distribution of teachers according to their age. It can be shown that there practically all ages are represented, and that the most of t hem ar e in 36-50 range (63%). Figure 2 shows that the 45% of tea chers has more than 20 years of teaching experience, and t hat more than the 50% has more than 15 years of teaching experience. Finally, figure 3 shows that m ore than the 60% of teachers who use e-learning platform has at most 5 years of experience in such platforms.

Figure 3. Distribution of tea chers ac cording to their e-learning tools experience in years.

Figure 4. Distribution of e-learning platforms according to grade.

Figure 5. Presential versus on-line use of e-learning platforms.

In the figures 4 and 5 we can see the most used e-learning platforms in Spain ac cording with the university grade (f irst grade or diplo mate studies, second grade or graduate studies and third grade or doctoral stu dies), and the presential vs. online use in e ach grade. Notice that Moodle [4] is clearly the first used e-le arning platform in all grades, and that WebCT [10] and .LRN [7] are both quasi-equal in the se cond place. Among the o thers e-learning plat forms used in S pain are proper university platform s (6 ca ses), Aula Global (3), Aula Web (2), ACME (1), eKASI (1), ecampus (1), SIFO (1), ADI (1), SWAD (1), MIT (1), GEN (1) and Drupal (1).

With respect to the use on-line or presential, we can emphasize that the character on-line is between 14% and 21% in the three grades, and the character blended learning (mixture of on-line and presential) is between 9% and 14% in the three grades. However, the character presential si gnificantly decreases with the grade, from the 60,3% in first grade, to 48.2% in second grade and finally to 30,5% in third grade. It is also significant that a gre ater grade, the greater the teachers who do not answer to this question.

In figures 6, 7, 8, 9, 10 and 11 (last pages of the paper), the results for each one of the topics and functionalities selected in this paper are shown:

- i. With respect to the K nowledge Level of the ese functionalities, we can see that there exists a group of functionalities with a high degre e of knowledge (greater than 50%): Content De livery, e-mail, Task-Exercises, Mailing Lists, GroupWork, Surveys, Exams, Self-assessment and forums. On the other hand, there exists a group of bad-known functionalities (low or no knowledge greater than 50%): P odcast, V odcast, Whiteboard, N otebook, S tudent Portfolio, Learning Paths, and Student Tracking.
- ii. With respect to the Training received for e ach one of the functionalities, we can remark that in general it was scarce: there is no func tionality with a high l evel o f training greater t han 25%. This is one of the more interesting results of the survey: the missing training.
- iii. Figure 8 shows the Usage Level, and we can see that Contents D elivery, e-ma il, f orums and task-e xercises are t he most ou tstanding fu nctionalities (hi gh level greater than 50%), while whiteboard, videoconference, student p ortfolio, learning paths, podcast and studen t tracking are the less used (not used). If we add mailing lists, G roupwork, surveys and exam s to t he most outstanding functionalities, the rest of func tionalities are rarely used.
- iv. Figure 9 shows the perception of t raining proficiency for each one of the functionalities, and c onfirms the results of topic ii. There is a general perception of lack of training.
- v. Figure 10 sho ws the perception of usefulness of the different functionalities. The most outstanding (with a high level of usefulness, greater than 50%) are Content Delivery, e -mail, mailing-lists, Groupw ork, Surveys, Tasks-exercises, exa ms, s elf-assessment, and Forum s. On the other hand, the less useful (deno ting no or low useful with a level grea ter than 5 0%) have be en Student tracking (the only functionality with a level of no useful gre ater than 50%), P odcast, V odcast, Notebook, Student Portfolio, and Learning Paths.
- vi. Figure 11 sh ows the pr eparation effort for ea ch functionality. This topic must be considered with care, and taking into account the results of the other topics, specially the usage level. If one funct ionality is not used, obviously its level of preparation effort should be null. Therefore, it can be shown how the results for the less used funct tionalities a re a lso the lowest in t his topic, and the most used functionalities have a relative high preparation effort level, such as content delivery and task-exe rcises. However other most use d functionalities such a s e-m ail and forum s have not a relative high degree of preparation effort.

IV. CONCLUSSION

In this paper we have showed the result so of a survey realized in Spain about the e-learning platforms functionalities.

In short, there are two main conclusions: (a) first of all, the most used e-learning platform in Spain is c learly Moodle[4]. And in second plac e, and in our opinion the main conclusion of this surve y, (b) it is the lack of t raining in the different functionalities. Therefore, it is apparent that there is a need for training on the different e-learning functionalities. If w e compare the set of functionalities where the teachers have less level of know ledge (top ic i), of usage (iii) and p erception of usefulness (v), t hen w e have alw ays th e fo llowing functionalities: Podcast, V odcast, S tudent P ortfolio, Le arning Paths, and Student Tracking.

We think t hat the different Spanish universities have to increase the training of university teachers not only on these functionalities but a lso on the different methodologies linked with them, in order to obtain the best use of all of them.

ACKNOWLEDGMENT

This work has been funded by the Spanish "Ministerio de Ciencia e Innovación" (Science and Innovation Ministry) under grant EA 2008-0120. O ur sincer ely acknowledgment to all people who has collaborated with this survey [15][16].
